1.0	Philippe Oechslin Stéphane Adamiste	17.02.2023	Final report

Management summary

Scope and objective of the examination

The objective of this examination was to assess to which extent the infrastructure and organisational measures supporting the operation of the Swiss Post's e-voting system in the cantons of Basel-Stadt (herein also referred to as "BS"), St. Gallen (herein also referred to as "SG"), and Thurgau (herein also referred to as "TG"), satisfy a subset of requirements (audit scope 3 - *Infrastructure and operation, c) Assess the infrastructure and organisational measures of the cantons*) set forth by the Federal Chancellery's ordinance on e-voting. In total, the examination included 167 criteria.

Methodology

The examiners looked for evidence of effort to comply with said criteria by performing interviews of the personnel in charge of the setup and operation of the e-voting system's infrastructure at cantonal level, by analysing the relating documentation (i.e., policies, procedures, specifications, reports, processes, etc.) and by observing the entire process of a test ballot.

The examination was carried out in two phases. Phase 1 consisted in a pre-audit, that took place in mid-June 2022. Resulting intermediary findings were transmitted to the cantons at the end of August, so that they could make improvements to their existing security measures. Phase 2 was conducted in mid-September.

Results

After phase 2 of the examination, the cantons have demonstrated a high level of compliance with the requirements of the ordinance on e-voting.

Four non-compliances (findings) were identified and reported.

Recommendations

Only succinct recommendations are provided in this document, as the observations formulated are self-explanatory. The implementation of those recommendations requires a small effort at the scale of the e-voting project in the examiners' opinion.

Authors

SCRT is the owner of the present report. The examination work was conducted conjointly by SCRT (represented by Stéphane Adamiste) and OS Objectif Sécurité (represented by Philippe Oechslin).

Final note

The examiners conclude this summary by thanking the cantons of Basel-Stadt, St. Gallen and Thurgau, and more particularly all the personnel that has been involved, for its cooperation and for the transparency demonstrated throughout the entire duration of the examination.

7 Context

1. Electronic voting (hereafter referred to as: “e-voting”) was introduced in Switzerland through multiple pilot schemes from 2004 onwards. A total of 15 cantons made e-voting possible in over 300 trials, until early 2019. Two implementations were available: the system provided by the canton of Geneva and the system operated by the Swiss Post (hereafter also referred to as “the Post”), initially developed by Scytl. In June 2019, the canton of Geneva announced the withdrawal of its e-voting system with immediate effect. It was followed in July of the same year by the announcement by the Swiss Post of the withdrawal of its e-voting system from operation to focus on improving the solution. Since then, e-voting is no longer possible in Switzerland.
2. In June 2019, the Swiss Federal Chancellery (hereafter also referred to as “Federal Chancellery”) was commissioned by the Federal Council to redesign a new trial phase, in collaboration with the cantons, using “e-voting systems, which are fully verifiable” [1]. This redesign of the trial phase focuses on four objectives:
 1. Further development of the e-voting systems
 2. Effective controls and monitoring
 3. Increased transparency and trust
 4. Stronger connection with the scientific community
3. A taskforce was set up to make proposals for the future of internet voting. To that end, the Federal Chancellery invited experts from academia and industry to engage in a broad dialogue on internet voting in Switzerland. After this dialog, the Federal Chancellery and the cantons published a final report on the redesign and relaunch of internet voting trials, with a catalogue of measures [2]
4. The Federal Council took note of the final report and commissioned the Federal Chancellery to amend the legal bases of the Confederation regarding e-voting. In April 2021, the Federal Council opened a consultation procedure for the redesign of the e-voting trials. The redesign includes both a partial revision of the Ordinance on Political Rights (PoRo) [3] and a complete revision of the Federal Chancellery Ordinance on Electronic Voting (“VEleS”, or “OEV”) [4]. The OEV specifies, among others, the requirements for authorising electronic voting, including the technical and administrative controls for approving an e-voting system.
5. The Federal Chancellery issued an audit concept for the examination of Swiss internet voting systems [5] defining the foundations for assessing the compliance of electronic voting systems with the draft OEV and its annex, as per chapter 26 of the annex of the draft OEV, and for obtaining recommendations for improvements.
6. In May 2022, the Federal Council enacted the partially revised Ordinance on Political Rights (PoRo) [6], which became applicable from Jul. 1st 2022. The totally revised Federal Chancellery Ordinance on Electronic Voting (OEV) [7] comes into force on the same date.

7. SCRT was mandated by the Federal Chancellery to assess the compliance of the cantons planning to use the revamped e-voting system against the requirements of the OEV applicable to cantons. The present report focusses on the examination of the perimeter defined as follows in the audit concept [8]: *Scope 3: Infrastructure and operation, c) Assess the infrastructure and organisational measures of the canton.*

8 Methodology

8.1 Process

8. The examination was based on SCRT’s information systems audit methodology. The process specifies four-phases, which are depicted in the figure below:

Figure 1 - Process

8.2 Collection of evidence

9. As a general principle, the examiners aimed at acquiring two types of evidence for each requirement. Types of evidence included: documents (e.g., policies, procedures, reports, etc.) and statements obtained from examinees during interviews. To ease the understanding by the examiners of the e-voting processes, the interview sessions were supported by a demo of the tasks performed by an e-voting administration board in the canton of Thurgau. This practical observation served as additional evidence to assess the compliance of the e-voting system with specific requirements (e.g., some features of the e-voting software).

8.3 Findings

10. The examiners raised a finding when evidence provided by the examinee did not provide satisfying assurance that the requirement is met (implicit miss) or when evidence provided explicitly indicates that the requirement is not or partially satisfied (explicit miss).

8.4 Classification of findings

11. The examiners used the following classification for their findings:

- » Fail - The finding identifies a failure to produce evidence of satisfying a requirement.
- » Partially fail - The finding identifies a partial failure to produce evidence of satisfying a requirement.
- » Potential improvement - The finding identifies a notable opportunity for improvement or optimisation.

12. Readers should note that the classification of findings indicated in this report only reflects the opinion of the examiners and may be subject to re-evaluation from relevant parties.

8.5 Relevance of the assessment criteria

13. The examiners raised an issue when the wording of a given requirement set in the OEV was perceived as unclear, or subject to interpretation, preventing the examiners from performing an objective assessment of the criterion.

8.6 Assumptions

8.6.1 Trustworthiness of statements

14. The examiners assume that the examinees were honest and transparent when providing answers to the examiners' assessment questions. The observation of the actual implementation of the OEV's requirements within the e-voting system was limited to the demo made by the e-voting representatives of the Thurgau canton carried out to verify the accuracy of the examinees' statements.

8.6.2 Enforcement of security measures

15. The examiners assume that the security measures described in the documents provided as evidence in the context of the present examination are implemented and are effective. No observation of the actual implementation of the OEV's requirements within the e-voting system, other than the demo organised in the canton of Thurgau as a support for the interview sessions, was carried out to verify the accuracy of the statements made in the security documents.

9 Examination criteria

16. This examination focussed on assessing the compliance of the Swiss Post’s e-voting system from the cantons’ standpoint against the following criteria:

Art. 11¹

Key	Requirement
Art. 11	<p>Disclosure of the source code and of the documentation on the system and its operation</p> <p>1 The canton shall ensure that the following documents are published:</p> <ul style="list-style-type: none"> a. the source code of the system software including files with relevant parameters; b. evidence that the machine-readable programmes were generated from the published software source code; c. the software documentation; d the development process documentation; e. instructions and other documents that experts require to be able to compile, execute and analyse the system on the basis of the source code within their own infrastructure; f. technical specifications of the main components of the system; g. the process documentation for operating, maintaining and securing the system; h. information on and descriptions of known flaws. <p>2 The following need not be published:</p> <ul style="list-style-type: none"> a. the source code for third-party components such as operating systems, databases, web and application servers, rights management systems, firewalls or routers, provided they are widely used and regularly updated; b. the source code for portals of authorities that are connected to the system; c. documents or parts of documents for which an exemption from publication is justified, in particular under the law on freedom of information or data protection.

Table 1 - E-voting requirements: Art. 11

Art. 14

¹ Although this article is not listed in the audit concept as a requirement applicable to the cantons, compliance with it has been evaluated by the examiners upon explicit request by the Federal Chancellery.

Key	Requirement
Art. 14	<p>Responsibility for running the ballot with electronic voting correctly</p> <p>1 The canton bears overall responsibility for running the ballot with electronic voting correctly.</p> <p>2 It must carry out important tasks itself.</p> <p>3 It may delegate the development of the software used, technical operational tasks and communication on questions about how the system works to external organisations.</p>

Table 2 - E-voting requirements: Art. 14

Cryptographic protocol requirements for complete verifiability

Key	Requirement
2.5	<p>Requirement for the cryptographic protocol: individual verifiability</p> <p>The voter is given proofs in accordance with Article 5 paragraph 2 in conjunction with Article 6 letters a and b to confirm that no attacker</p> <ul style="list-style-type: none"> » has altered any partial vote before the vote has been registered as cast in conformity with the system; » has not maliciously cast a vote on the voter's behalf which has subsequently been registered as a vote cast in conformity with the system and counted.
2.6	<p>Requirement for the cryptographic protocol: universal verifiability</p> <p>The auditors receive a proof in accordance with Article 5 paragraph 3 letter a in conjunction with Article 6 letters a and c to confirm that no attacker:</p> <ul style="list-style-type: none"> » after the votes were registered as cast in conformity with the system, has altered or misappropriated any partial votes before the result was determined; » has inserted any votes or partial votes not cast in conformity with the system which were taken into account in determining the result.
2.9.1.2	<p>For soundness of the proofs referred to in Number 2.5</p> <p>The following system participants may be considered trustworthy:</p> <ul style="list-style-type: none"> » set-up component » print component » one of four control components per group, leaving open which one it is
2.9.2.2	<p>For soundness of the proofs referred to in Number 2.6</p> <p>The following system participants may be considered trustworthy:</p> <ul style="list-style-type: none"> » one of four control components per group, leaving open which one it is » one auditor in any group, leaving open which auditor it is » one technical aid from a trustworthy auditor, leaving open which aid it is

2.9.3.2	<p>For preserving voting secrecy and excluding premature partial results in accordance with Number 2.7</p> <p>It may be assumed that trustworthy channels exist to distribute electronic certificates among system participants. Number 3.8 applies.</p>
2.13.3	<p>Requirements for the definition and description of the cryptographic protocol</p> <p>It may be assumed that trustworthy channels exist to distribute electronic certificates among system participants. Number 3.8 applies.</p>

Table 3 - E-voting requirements: Cryptographic protocol requirements for complete verifiability (Art. 5)

Trustworthy components in accordance with Number 2 and for their operation

Key	Requirement
3.1	The operation of the set-up component and at least one control component in the group which contains part of the key for decrypting the votes is the direct responsibility of the canton and must take place within its infrastructure. Outsourcing to a private system operator is not permitted.
3.2	Sufficient entropy must be ensured when selecting random values, in particular for set-up components and control components.
3.3	Auditors must verify the proofs referred to in Number 2.6 at least once and must use a technical aid referred to in Number 2 for this purpose.
3.4	The operational requirements for set-up components in accordance with Number 3 also apply to technical aids used by the auditors. Within the scope of their responsibility under cantonal law, the auditors may provide for derogations.
3.5	With the exception of the components mentioned under Numbers 3.1 and 3.3, the canton may delegate the operation of any part of the system, including the control components and the print component, to private service providers. A private operator of the print component may only perform operational tasks that are required for preparation, packaging and delivery.
3.6	Trustworthy components (set-up components, print components, auditors' technical aids and control components) must be set up, updated, configured and secured in an observable process.
3.7	Before installing software, all programs must be checked using an official and trustworthy reference to ensure that the files are the correct and unaltered version.
3.8	When other system participants' electronic certificates are installed, their authenticity must be ensured. To that end, there should be a manual process in which people transfer the electronic certificates from one machine to another via a physical data carrier in accordance with 3.13.

Key	Requirement
3.9	The timing for updating all software of trustworthy components must be such that the expected benefits outweigh the potential hazards.
3.10	Set-up components, print components and auditors' technical aids that are involved in any way in the processing of critical data must be physically monitored during the entire computing time by two persons and until any critical data have been deleted or securely stored. At most, they may be interconnected by visible physical cables so that it is as evident as possible that no other machines can access them until the confidential data is destroyed.
3.11	Trustworthy components may not be connected to the internet when installing or updating software.
3.12	In principle, critical data must be destroyed after use. If there are good reasons, secure storage of the data carrier is also permitted as an alternative.
3.13	Data exchange or storage media, such as USB flash drives, must be removed after the data has been uploaded to the trustworthy components and may only be reused before the data is destroyed if there was no critical data on the trustworthy component before the data was uploaded. Data exchange or storage media must be reformatted and any data on them must be destroyed before they are used with the aid of a component operated in accordance with the requirements for trustworthy components.
3.14	Logical or physical access to trustworthy components or data carriers containing critical data must be impossible without another person becoming aware of it, for example by having to assist in granting access (strict two person principle).
3.15	Success in gaining unauthorised access to a control component should not as far as possible give any advantage in an attempt to access another control component unnoticed. In addition to the requirements set out in Number 3, the following requirements apply in this respect: <ul style="list-style-type: none"> » If a person has physical or logical access to a control component, that person may not have access to any other control component. » The hardware, the operating systems and the monitoring systems for the control components should be as distinct as possible from each other. » The control components should be connected to different local networks. » A control component must take the form of a physical device. Virtualisation across multiple physical devices is not permitted.
3.16	Control components must be designed to recognise unpermitted instances of access and to alert the persons responsible. The persons responsible should arrange external monitoring measures, such as the monitoring and the manipulation-resistant logging of network traffic or physical monitoring with cameras that are under their control. The persons responsible must be considered to be particularly trustworthy and reliable.
3.17	Trustworthy components may perform only the intended operations.
3.18	The software for the auditors' technical aids must be obtained from a different system developer from the one who developed the main part of the software for the other system components. The publication of the software for the technical aid

Key	Requirement
	under a licence that meets the criteria for open source software may justify an exception. If auditors use several technical aids, this provision applies to at least one of the technical aids.
3.19	All procedures for dealing with trustworthy components must be documented in writing and in a manner that is easily understood by the persons concerned.
3.20	Any access to and use of a trusted component or data carrier containing critical data must be logged.

Table 4 - E-voting requirements: Requirements for trustworthy components in accordance with Number 2 and their operation

Voting process

Key	Requirement
4.1	The person voting must declare that he or she is aware of the rules on electronic voting and of his or her own responsibilities.
4.2	Before casting a vote, the person voting is notified that he or she is taking part in a ballot in the same way as voting by post or voting in person at the ballot box. The person voting may only cast his or her vote after confirming that he or she has taken note of this.
4.3	When voting, the person voting is requested to check the proofs in accordance with Number 2.5 against the verification reference and to report any doubts as to its correctness to the canton.
4.4	At any time before casting an electronic vote definitively, the voter may still choose to cast his or her vote via a conventional voting channel.
4.5	The client-side system as it appears to the person voting does not influence the person voting in his or her decision on how to vote.
4.6	The user guidance must not lead persons voting to cast hasty or ill-considered votes.
4.7	The system does not offer the person voting any functionality allowing them to print out or store their vote.
4.8	The person voting is not shown any information after the voting process is completed about the content of the vote that has been encrypted and cast.
4.9	A voter who is unable to cast a vote because third parties have cast a vote using his or her voting papers unlawfully may still be allowed to vote provided the canton declares the unlawfully cast vote null and void. Voting secrecy in accordance with Number 2.7 must be preserved.
4.10	Voters with disabilities may be provided with a simplified procedure for checking the proofs. Only in such a case are derogations from the requirements set out in Number 2.9.1 permitted.
4.11	As long as the system has not registered confirmation of a definitive electronic vote, the voter may still choose to cast his or her vote via a conventional voting channel.

Key	Requirement
4.12	The use of a means of authentication independent of electronic voting is permitted. Effects on the integrity of the verification of the right to vote and the preservation of voting secrecy must be examined in detail as part of the risk assessment.

Table 5 - E-voting requirements: voting process

Preparations for the ballot

Key	Requirement
5.1	If the electoral register data is imported from a third-party system that is outside the canton's control, the data must be encrypted and signed. The signature must be verified on receipt of the data. For delivery to the printing office, the provisions of Number 7 take precedence.
5.2	The data required to examine the proofs in accordance with Number 2.6 must be handed over to the auditors.

Table 6 - E-voting requirements: Preparations for the ballot

Requirements for polling cards

Key	Requirement
6.1	If possible, the polling cards shall be designed so as to allow voters with a disability barrier-free access to electronic voting.
6.2	Security elements on the polling card (e.g., scratch codes) may only be used if there is a confirmation that the concealed information is well protected against unauthorised reading.
6.3	If it is decided not to use security elements to protect confidential information on the voting card, organisational procedures must be in place to ensure security.

Table 7 - E-voting requirements: Requirements for polling cards

Requirements for printing offices

Key	Requirement
7.1	The printing data used to produce the polling cards are transmitted encrypted and signed. Alternatively, a data carrier containing this data may be delivered in person. In this case, the data carrier must be transported and delivered to the printing office by two persons, who must both stay with the data carrier until it is delivered.
7.2	The encryption must meet the requirements of eCH standard 0014, Chapter 7.5. If encryption is symmetric, the secret decryption key is sent to the persons responsible at the printing office via a secure secondary channel.

Key	Requirement
7.3	The person responsible at the printing office who receives the data carrier must sign an acknowledgement of receipt.
7.8	The channel between the printing office and the voters may only be considered trustworthy if the bodies responsible under cantonal law deliver the packaged voting papers to the voters by post or ensure that it is handed over in person.

Table 8 - E-voting requirements: Requirements for printing offices

Information and instructions

Key	Requirement
8.1	The body responsible at cantonal level must issue guidelines on providing information to citizens about electronic voting.
8.2	The guidelines ensure that the information is authorised by the responsible bodies.
8.3	Tips and instructions on vote casting are given on the internet along with information on voters' responsibilities. This should counter over-hasty or ill-considered vote casting behaviour.
8.4	Verifiability, further security measures and the procedure in the event of anomalies are explained to voters in an accessible manner.
8.5	Voters are told what they have to pay attention to in order to cast their vote securely.
8.6	Voters are given instructions on how to delete their vote from all the memories on the device used for entering the vote.
8.7	Voters may request support if they have questions about electronic voting.
8.8	Voters are requested to report incorrectly displayed proofs in accordance with Number 2.5 such as verification codes or other verification steps with negative results to the body responsible at cantonal level. This request is also made in the instructions sent out with the voting papers.
8.9	Voters are requested to keep the voting papers with the security elements in fulfilment of Number 2.5 securely until they cast their final vote or until the voting process is concluded.
8.10	Voters are given the information required to check the authenticity of the website and the server used for voting. The informative value of a successful check must be supported by the use of cryptographic resources according to the best practices.
8.11	The information essential for secure voting is sent with the voting papers. Voters are told that if in doubt, they should comply with the information in the voting papers rather than the information displayed on the user device.
8.12	The measures taken to preserve voting secrecy are explained to voters.
8.13	Known flaws and the need for action associated with them are communicated transparently.

8.14	The auditors should be suitably informed about and trained in the processes that determine the accuracy of the result, the preservation of voting secrecy and the exclusion of premature partial results (for example key generation, printing the voting papers, decryption and tallying). They must be able to understand the essential aspects of the processes and their significance.
------	--

Table 9 - E-voting requirements: Information and instructions

Opening and closing the electronic voting channel

Key	Requirement
9	The electronic voting channel is only available during the permitted period.

Table 10 - E-voting requirements: Opening and closing the electronic voting channel

Tallying votes in the electronic ballot box

Key	Requirement
11.1	The decryption of the votes and the tallying may not begin before Polling Sunday.
11.2	The canton carries out the decryption and tallying within its own infrastructure.
11.3	The canton must ensure that the decryption of votes and their tallying is documented. The minutes are released by the body responsible at cantonal level.
11.4	From the decryption of votes to the transmission of the result of the ballot, any access to the system or to any of its components must be made jointly by at least two persons; it must be recorded in writing and it must be possible for the auditors to check it.
11.5	If the result data is transmitted to a third-party system that is outside the canton's control, the data must be encrypted and signed.
11.6	The system allows the polling card to be used to determine whether someone has cast an electronic vote.
11.7	Auditors must be present during decryption and tallying. The cantons may permit additional remote auditing work.
11.8	If components used to tally votes are not trustworthy in accordance with Number 2.4, the same requirements apply to these components as to set-up components under Number 3.
11.9	The auditors exercise their responsibility in accordance with cantonal law when examining the proofs in accordance with Number 2.6.
11.10	The body responsible at cantonal level submits all relevant indicators of the correctness of the result to the auditors. This includes, in addition to the proofs in accordance with Number 2.6, in particular the number and nature of anomalies reported to the canton by voters.

11.11	The canton anticipates any anomalies and, in consultation with the bodies concerned, draws up an emergency plan specifying the appropriate course of action. It creates transparency towards the public.
11.12	Statistical methods must be used to check the plausibility of the result, provided they are available and there is sufficient data.

Table 11 - E-voting requirements: Tallying votes in the electronic ballot box

Confidential data

Key	Requirement
12.1	It is guaranteed that neither employees nor externals hold data that allow a connection to be made between the identity of persons voting and the votes they have cast.
12.2	It is guaranteed that neither employees nor externals hold data before the decryption of the votes that allow the premature determination of partial results.
12.3	The canton may not pass on to private companies its part of the key for decrypting the votes which it has on the control component that it operates in accordance with Number 3.1.
12.4	The canton must treat the results of the ballot as confidential between the time the votes are decrypted and the time of publication.
12.5	The canton must ensure that data that indicate whether a voter has voted electronically are treated as confidential.
12.6	The canton must treat the individual votes as confidential after they have been tallied.
12.7	The canton must ensure that vote and election results in small constituencies are treated as confidential.
12.8	Following validation and in accordance with a predetermined and documented process, all data created as part of the electronic ballot that relate to the individual votes received and that are classified as confidential must be destroyed.

Table 12 - E-voting requirements: Confidential data

Threats

Key	Requirement
13.1	The threats listed in Numbers 13.3-13.40 are of a general nature and form a minimum basis; this must be added to. They relate to the security objectives and must be taken into account when identifying risks. Depending on the system vulnerabilities identified, when the various bodies carry out their risk assessments, the list should be updated with full details and considered based on the actual circumstances and depending on the specific threat.
13.2	The following are considered to be potential threats:

Key	Requirement	
	<ul style="list-style-type: none"> » inadvertent or intended electronic or physical threats from internal or external actors; » threats resulting from a malfunction of the system or system-supporting elements 	
	Description	Security objective concerned (in accordance with Art. 4 para. 3)
13.3	Malware changes the vote on the user device.	Accuracy of the result
13.4	An external attacker redirects the vote using domain name server spoofing (DNS spoofing) ² .	Accuracy of the result
13.5	An external attacker changes vote using the man-in-the-middle (MITM) technique ³ .	Accuracy of the result
13.6	An external attacker sends a maliciously altered ballot paper using MITM.	Accuracy of the result
13.7	An internal attacker manipulates the software, causing it not to store the votes.	Accuracy of the result
13.8	An internal attacker changes the votes.	Accuracy of the result
13.9	An internal attacker inserts votes.	Accuracy of the result
13.10	A hostile organisation infiltrates the system with the aim of falsifying the result.	Accuracy of the result
13.11	An internal attacker copies voting papers and uses them.	Accuracy of the result
13.12	An external attacker uses social engineering techniques to distract the person voting from following the security measures (individual verifiability).	Accuracy of the result
13.13	An external attacker infiltrates the canton's infrastructure electronically, physically or by means of social engineering and extracts security-relevant data while the parameters of the ballot are being set.	Accuracy of the result

² Also known as DNS poisoning. This is an attack which successfully falsifies the correlation between a host name and the related IP address.

³ The attacker in a man-in-the-middle attack. This is a type of attack used in computer networks. The attacker is positioned either physically or logically between the two communication partners and via its system has full control of the data traffic between two or more network participants and can view or even manipulate any information it wants.

Key	Requirement		
	13.14	An external attacker infiltrates the printing office's infrastructure electronically, physically or by means of social engineering and extracts the codes of the polling cards.	Accuracy of the result
	13.15	An external attacker infiltrates the postal service's infrastructure electronically, physically or by means of social engineering and steals polling cards.	Accuracy of the result
	13.16	An error occurs in the individual verifiability.	Accuracy of the result
	13.17	An error occurs in the universal verifiability.	Accuracy of the result
	13.18	An error occurs in an auditor's technical aid.	Accuracy of the result
	13.19	A backdoor ⁴ is introduced into the system via a software dependency and is exploited by an external attacker to access the system.	Accuracy of the result, preservation of voting secrecy and exclusion of premature results, accessibility and operability of the voting system, protection of information intended for voters from manipulation, prevention of improper use of evidence of voting behaviour
	13.20	Malware on the user device sends the vote to a hostile organisation.	Preservation of voting secrecy and exclusion of premature results
	13.21	The vote is redirected using DNS spoofing.	Preservation of voting secrecy and exclusion of premature results
	13.22	An external attacker reads a vote using MITM.	Preservation of voting secrecy and exclusion of premature results
	13.23	An internal attacker uses the key and decrypts non-anonymous votes.	Preservation of voting secrecy and exclusion of premature results
	13.24	While checking the accuracy of the processing and tallying, voting secrecy is breached.	Preservation of voting secrecy and exclusion of premature results
	13.25	An internal attacker reads the votes at an early stage without having to decrypt the votes.	Preservation of voting secrecy and exclusion of premature results
	13.26	A hostile organisation infiltrates the system with the aim of	Preservation of voting secrecy and exclusion of premature results

⁴ A backdoor is a portion of software that allows access to the computer or an otherwise protected function of a computer program by bypassing normal access protections.

Key	Requirement	
		breaching voting secrecy or obtaining premature results.
13.27	An error in the encryption process renders it inoperable or reduces its effectiveness.	Preservation of voting secrecy and exclusion of premature results
13.28	Malware on the user device makes voting impossible.	Accessibility and operability of the voting system
13.29	A hostile organisation carries out a denial-of-service (DOS) ⁵ attack.	Accessibility and operability of the voting system
13.30	An internal attacker carries out an incorrect configuration; it does not get to the tallying.	Accessibility and operability of the voting system
13.31	An internal attacker falsifies the cryptographic proofs of universal verifiability.	Accessibility and operability of the voting system
13.32	A technical error in the system causes the system to be unavailable at the time of the count.	Accessibility and operability of the voting system
13.33	One of the auditors' technical aids does not work at the time of tallying.	Accessibility and operability of the voting system
13.34	A hostile organisation infiltrates the system with the aim of disrupting operations, manipulating voter information or stealing proofs of the voting behaviour of the persons voting.	Accessibility and operability of the voting system, protection of information intended for voters from manipulation, prevention of improper use of evidence of voting behaviour
13.35	An internal attacker steals voters' address data.	Protection of personal information relating to voters
13.36	Malware influences voters' opinions.	Protection of information intended for voters from manipulation
13.37	An internal attacker manipulates the information website or voting portal and thereby deceives voters.	Protection of information intended for voters from manipulation
13.38	An internal attacker tells voters whether and how they have to vote. After decryption, he finds evidence in the infrastructure that the voters have followed the instructions.	Prevention of improper use of evidence of voting behaviour

⁵ In digital data processing, this is the non-availability of a service that should be available.

Key	Requirement	
	13.39	<p>An external attacker tells voters whether and how they have to vote and demands evidence that they have followed the instructions.</p> <p>Prevention of improper use of evidence of voting behaviour</p>

Table 13 - E-voting requirements: Threats

Identifying and reporting security events and vulnerabilities; dealing with security events and making security improvements

Key	Requirement
14.1	<p>An infrastructure monitoring system detects incidents that could endanger the security, including availability, of the system and alerts the responsible personnel. The personnel deal with incidents according to a predetermined procedure. Crisis scenarios and rescue plans serve as guidelines (and include a plan that guarantees that voting-related activities can continue) and are applied as required.</p> <p>Errors in the registration of votes in the control components and in the ballot box must be detected. Further information relating to the error must be available in order to identify and eliminate the cause. Any incidents detected must be reported to the body responsible at cantonal level.</p>
14.2	<p>Records are created on the infrastructure whose recording, transmission and storage are resistant to manipulation (system logs). The records are consistent with each other and allow the relevant events to be traced when investigating suspected manipulation or errors. They serve as evidence of the complete, unfalsified and exclusive tallying of votes cast in conformity with the system, of preservation of voting secrecy and of the exclusion of premature partial results.</p> <p>The content of the records covers at least the following events:</p> <ul style="list-style-type: none"> » start and end of the audit, identification and authentication processes; » start, restart and end of the voting or election phase; » start of the tallying with the determination of the results; » conduct and results of any self-tests; » malfunctions identified in elements of the IT infrastructure that affect the ability to operate. <p>The date and time of each event, the type of event, the possible originator and the result in terms of failure or success are documented.</p> <p>The system logs are made available to the body responsible at cantonal level in such a way that it can interpret the information.</p>
14.3	<p>The monitoring and recording of system logs are subject to a continuous improvement process. The improvement process involves an open dialogue between those involved and a regular and objective assessment of the</p>

	effectiveness of the instruments and processes used. The results of these evaluations will be taken into account.
14.4	The monitoring and recording of system logs in no way detracts from the effectiveness of the measures taken to preserve voting secrecy.
14.7	It is possible to cast control votes using authentication credentials that are not assigned to any voter. The content of these control votes is recorded. The tallying of the control votes is compared with the records. It must be ensured that the control votes are dealt with in as similar a way possible as votes cast in conformity with the system, while at the same time ensuring that they are not counted.
14.8	Infrastructure availability must be checked and recorded at selected intervals.
14.9	All parts of the voting system must be regularly updated in a predetermined and documented process in order to eliminate weaknesses that have become known.
14.10	The measures for monitoring and keeping records of system usage, the activities of administrators and of malfunction records must be described in detail, implemented, monitored and reviewed.

Table 14 - Identifying and reporting security events and vulnerabilities; dealing with security events and making security improvements

Use of cryptographic measures and key management

Key	Requirement
15.1	Electronic certificates must be managed according to the best practices.
15.2	In order to guarantee the integrity of data records that substantiate the accuracy of the result and ensure that critical data, including the authorities' identification and authentication data, are kept secret, effective cryptographic measures that correspond to the state of the art must be used.
15.3	To ensure that critical data are kept secret, effective cryptographic measures are used in the infrastructure that correspond to the state of the art. Such data is always stored encrypted on data carriers.
15.4	Basic cryptographic components may only be used if the key lengths and algorithms correspond to the current standards (e.g. NIST, ECRYPT, ESigA). The electronic signature meets the requirements of an advanced electronic signature in accordance with the Federal Act of 18 March 2016 on Electronic Signatures (ESigA). The signature must be verified by means of an electronic certificate that has been issued by a recognised supplier of certificate services under the ESigA.

Table 15 - E-voting requirements: Use of cryptographic measures and key management

Secure electronic and physical exchange of information

Key	Requirement
16.1	All infrastructure components must be operated in a separate network zone. This network zone must be protected in relation to other networks by an appropriate routing control.
16.2	As a principle, electronic voting should be clearly separated from all other applications.

Table 16 - E-voting requirements: Secure electronic and physical exchange of information

Organisation of information security

Key	Requirement
18.1	All roles and responsibilities for the operation of the system must be precisely defined, assigned and communicated.
18.2	The initial configuration of the infrastructure, whether with regard to hardware, software or access rights, and any modification must be approved beforehand.
18.3	The risks in connection with third parties (contractors such as suppliers and service providers) must be identified and if necessary reduced by means of suitable contractual agreements. Compliance with the agreements must be appropriately monitored and reviewed throughout their term.

Table 17 - E-voting requirements: Organisation of information security

Management of intangible and tangible resources

Key	Requirement
19.1	All intangible and tangible resources in the sense of the term asset in the standard ISO/IEC 27001, 2013, Information technology - Security techniques - Information security management systems - Requirements , relevant in the context of electronic voting (organisation as a whole, in particular the organisational processes and the information processed in these processes, data carriers, facilities for processing information of the infrastructure and premises of the infrastructure) are recorded in an inventory. A list must be kept of human resources. The inventory and human resources list must be kept up to date. Each intangible and tangible resource is assigned a person who takes responsibility for it.
19.2	The acceptable use of intangible and tangible resources must be defined.
19.3	Classification guidelines for information must be issued and communicated.
19.4	Procedures must be devised for the labelling and handling of information.

Table 18 - E-voting requirements: Management of intangible and tangible resources

Trustworthiness of human resources

Key	Requirement
20.1	Suitable policies and procedures must be devised and promulgated in order to guarantee the trustworthiness of human resources before, during and after termination of employment or in the case of a change of activity.
20.2	Heads of human resources must accept full responsibility for guaranteeing the trustworthiness of human resources.
20.3	All human resources must be acutely aware of the significance of information security. To this end, an education and training programme that is tailored to the tasks concerned must be devised and operated.

Table 19 - E-voting requirements: Trustworthiness of human resources

Physical and environment security

Key	Requirement
21.1	The security perimeters of the various premises of the infrastructure are clearly defined.
21.2	For physical entry to these various infrastructure premises, entry controls must be defined, implemented and appropriately checked.
21.3	To guarantee the security of devices within and outside the infrastructure premises, appropriate policies and procedures must be defined and compliance therewith monitored and reviewed.
21.4	All data must be processed and in particular stored exclusively in Switzerland.

Table 20 - E-voting requirements: Physical and environment security

Management of communication and operations

Key	Requirement
22.1	Obligations and areas of responsibility must be apportioned so that the risks originating from human resources relating to operations and communications are reduced to residual risks that are compatible with the risk acceptance criteria.
22.2	Appropriate measures must be taken to protect against malware.
22.3	A detailed plan for data backup must be prepared and implemented. The data backup must be regularly reviewed to check that it is functioning correctly.
22.4	Appropriate measures must be defined and implemented to protect the network from the threats listed in the risk assessment in accordance with Article 4 and in connection with Number 13 and for the security of network services.
22.5	The procedures for using removable data carriers and for disposing of data carriers must be regulated in detail.

Table 21 - E-voting requirements: Management of communication and operations

Allocation, administration and withdrawal of access and admission authorisations

Key	Requirement
23.1	It must be ensured that, during the ballot, any subsequent change in physical and logical access rights takes place only with the consent of the body responsible at cantonal level.
23.2	Access to infrastructure and software must be regulated and documented in detail on the basis of a risk assessment. In high-risk areas and for all manual operations in connection with the electronic ballot box (e.g. opening the voting channel, closing the voting channel, starting tallying), operations must be conducted by at least two persons. Manual operations in connection with the electronic ballot box (e.g. opening the voting channel, closing the voting channel, starting tallying) must be expressly authenticated.
23.3	It must be guaranteed that information on the voting portal and related information pages cannot be changed without authorisation.
23.4	During the ballot, access of any nature to the infrastructure that is of no relevance to the ballot must be prevented.
23.5	It must be ensured that none of the elements of the client-sided authentication credentials can be systematically intercepted, changed or redirected during transmission. For authentication, measures and technologies must be used that sufficiently minimise the risk of systematic abuse by third parties.

Table 22 - E-voting requirements: Allocation, administration and withdrawal of access and admission authorisations

Development and maintenance of information systems

Reliable and verifiable compilation and deployment

Key	Requirement
24.3.5	The quality of the evidence of reliable and verifiable compilation and reliable and verifiable deployment must be confirmed by the presence of at least two witnesses from different institutions or by technical procedures to establish the truth of the evidence in the light of current academic knowledge and experience.
24.3.6	The chain of evidence of reliable and verifiable compilation and deployment is made publicly available.

Table 23 - E-voting requirements: Reliable and verifiable compilation and deployment

Systematic correction of flaws

Key	Requirement
24.4.1	<p>Processes are defined for the correction of flaws. The processes include:</p> <ul style="list-style-type: none"> » documentation of specific aspects, in particular with regard to the traceability of flaws for all versions of the software, and of the methods used to ensure that system users have information on flaws, corrections and possible corrective actions; » the obligation to describe the nature and impact of all security flaws, information on the status of work to find a solution and the corrective measures adopted; » a description of how system users can make reports and enquiries about suspected flaws in the software known to the software developers; » a procedure requiring a timely response and automatic dispatch of security flaw reports and appropriate corrective actions to registered system users who may be affected by the flaw.

Table 24 - E-voting requirements: Systematic correction of flaws

Learnability

Key	Requirement
25.6.2	Persons who operate and use the system must be trained and provided with the necessary documentation.
25.6.3	Training includes the opportunity to train on a system designed for training purposes.
25.6.4	Help on using the system must be readily available.

Table 25 - E-voting requirements: Learnability

10 Examination results

17. This section enumerates the results of the examination for each item of the examination criteria.

Art. 11

Key	Art 11
Requirement	<p>Art. 11 Disclosure of the source code and of the documentation on the system and its operation</p> <p>1 The canton shall ensure that the following documents are published:</p> <ul style="list-style-type: none"> a. the source code of the system software including files with relevant parameters; b. evidence that the machine-readable programmes were generated from the published software source code; c. the software documentation; d the development process documentation; e. instructions and other documents that experts require to be able to compile, execute and analyse the system on the basis of the source code within their own infrastructure; f. technical specifications of the main components of the system; g. the process documentation for operating, maintaining and securing the system; h. information on and descriptions of known flaws. <p>2 The following need not be published:</p> <ul style="list-style-type: none"> a. the source code for third-party components such as operating systems, databases, web and application servers, rights management systems, firewalls or routers, provided they are widely used and regularly updated; b. the source code for portals of authorities that are connected to the system; c. documents or parts of documents for which an exemption from publication is justified, in particular under the law on freedom of information or data protection.
Observation	<p>During the setup phase, specific software is used to generate the polling cards in the form of PDF documents. The cantons of Basel-Stadt and Thurgau use the <i>VotingCardPrintService</i> from the Swiss Post, while the canton of St. Gallen uses <i>VOTING Stimmunterlagen</i> from Abraxas.</p> <p>The software runs on a trusted component and manipulates critical data.</p> <p>The source of both pieces of software is not published.</p>

	<p>A set of scripts are also used by the cantons to simplify the operations that need to be carried out on the laptops. The source of these scripts is not published.</p> <p>Both the software used to create PDF files and the scripts do not fall under the exceptions of art. 11.2.a since these third-party components are not widely used but rather tools used only for the Swiss e-voting system.</p>
Evidence	Prozesse E-Voting V0.94, step 0.3.3
Result	Fail
Finding	The source code of the software used to generate the polling cards and of the helper scripts is not published.
Relevance	N/A

Table 26 – Examination results: OEV article 11

Art. 14

Key	Art. 14
Requirement	<p>Responsibility for running the ballot with electronic voting correctly</p> <p>1 The canton bears overall responsibility for running the ballot with electronic voting correctly.</p> <p>2 It must carry out important tasks itself.</p> <p>3 It may delegate the development of the software used, technical operational tasks and communication on questions about how the system works to external organisations.</p>
Observation	<p>The <i>Konzept E-Voting</i> document lists the cantons' units involved in e-voting, as well as their areas of responsibilities. The cantons are responsible for the introduction, implementation and operation of e-voting, including:</p> <ul style="list-style-type: none"> » Preparation of the ballots; » Generation, printing and packaging of the voting cards; » Initialisation and encryption of the ballot box; » Electronic voting of eligible voters (voting and election period); » Shuffling and decoding of the ballot box / counting; » Post-processing of the ballot box. » The cantons rely on third parties for the development and operation of the e-voting software, the printing and packaging of the voting cards, some IT tasks performed on the laptops used to manage ballots (e.g. elaboration of the image), as well as part of the communication to the general public regarding the functioning of the system (in the canton of St. Gallen).

Requirement for the cryptographic protocol: individual verifiability

Key	2.5
Requirement	<p>Requirement for the cryptographic protocol: individual verifiability</p> <p>The voter is given proofs in accordance with Article 5 paragraph 2 in conjunction with Article 6 letters a and b to confirm that no attacker</p> <ul style="list-style-type: none"> » has altered any partial vote before the vote has been registered as cast in conformity with the system; » has maliciously cast a vote on the voter's behalf which has subsequently been registered as a vote cast in conformity with the system and counted.
Observation	<p>The examiners assume that the properties depicted in Article 5 paragraph 2 in conjunction with Article 6 letters a and b (which are not part of the present audit scope) are met.</p> <p>When a vote has been submitted, and before it is confirmed, verification codes are displayed to the voter by the e-voting system. If identical to the codes on the voting material, they prove that partial votes have not been altered. If a voter logs in after a vote has been confirmed, the finalisation code is displayed. The absence of such code at login proves that no vote was cast maliciously.</p>

Requirements for trustworthy components in accordance with Number 2 and for their operation

Key	3.1
Requirement	The operation of the set-up component and at least one control component in the group which contains part of the key for decrypting the votes is the direct responsibility of the canton and must take place within its infrastructure. Outsourcing to a private system operator is not permitted.
Observation	The cantons assume the responsibility for the set-up component (a.k.a. <i>configuration computer</i>) and the control component (a.k.a. <i>decryption computer</i>) containing part of the key for decrypting the votes. They operate these components within their own infrastructure.

Table 47 – Examination results: OEV paragraph 3.14

Key	3.15
Requirement	<p>Success in gaining unauthorised access to a control component should not as far as possible give any advantage in an attempt to access another control component unnoticed. In addition to the requirements set out in Number 3, the following requirements apply in this respect:</p> <ul style="list-style-type: none"> » If a person has physical or logical access to a control component, that person may not have access to any other control component. » The hardware, the operating systems and the monitoring systems for the control components should be as distinct as possible from each other. » The control components should be connected to different local networks. » A control component must take the form of a physical device. Virtualisation across multiple physical devices is not permitted.
Observation	<p>The cantons physically host one of the e-voting system’s control components (a.k.a. the <i>decryption computer</i>), in an offline-mode, whereas the other control components are hosted in the Post’s premises. Therefore, gaining unauthorised access to the control component hosted by the cantons does not provide any advantage to access another control components.</p> <p>The cantons’ representatives having physical or logical access to the local control component have no access to the other control components, which are accessed solely by the Post’s employees.</p> <p>The cantons’ representatives monitor their local control component, whereas the other control components are monitored by the Post’s employees.</p> <p>The control component operated by the cantons runs on dedicated hardware (i.e. a laptop procured directly by the cantons) and on the Windows 10 operating system; the control components operated by the Post run on physical servers, three of them on Linux distributions, the last one on Windows.</p>

Finding	N/A
Relevance	N/A

Table 115 – Examination results: OEV paragraph 14.4

Key	14.7
Requirement	It is possible to cast control votes using authentication credentials that are not assigned to any voter. The content of these control votes is recorded. The tallying of the control votes is compared with the records. It must be ensured that the control votes are dealt with in as similar a way possible as votes cast in conformity with the system, while at the same time ensuring that they are not counted.
Observation	The <i>Prozesse E-Voting document</i> describes how control votes are generated, imported into the system, submitted (one vote per member of

	<p>the voting office) and checked (the voting office members verify that the vote they have cast are identical to the votes tallied) as part of an electronic ballot.</p> <p>The voting procedure is the same for control votes as for regular votes. Control votes are cast into a dedicated ballot box to ensure that they are not counted.</p>

Table 116 – Examination results: OEV paragraph 14.7

Key	14.8
Requirement	Infrastructure availability must be checked and recorded at selected intervals.
Observation	During the voting period, the cantons regularly cast a vote with specific test polling cards, which allows verifying that the infrastructure is available.
Evidence	Prozesse E-Voting V0.94, step A3
Result	Pass
Finding	N/A
Relevance	N/A

Table 117 – Examination results: OEV paragraph 14.8

Key	14.9
Requirement	All parts of the voting system must be regularly updated in a predetermined and documented process in order to eliminate weaknesses that have become known.
Observation	<p>During the preparation phase of a ballot, the Admin-Board reviews the weaknesses affecting the components of the e-voting system under their control (i.e. the laptops) that have been published and decides whether those components must be updated. Updates are not performed directly on the computers. Instead, a new image including the latest updates available is created and installed in offline mode.</p> <p>This operation occurs 8 to 10 weeks before a ballot. After this period, if a vulnerability is disclosed, the provider of the e-voting system (i.e. the Swiss Post) alerts the cantons and a risk-based decision is taken.</p>

Table 121 – Examination results: OEV paragraph 15.2

Key	15.3
Requirement	To ensure that critical data are kept secret, effective cryptographic measures are used in the infrastructure that correspond to the state of the art. Such data is always stored encrypted on data carriers.
Observation	From the cantons’ perspective, the infrastructure components storing the e-voting critical data include laptops, data carriers (USB memory sticks), and smartcards. The laptops’ hard disk drives are encrypted using the OS’ native

	<p>solution (BitLocker). The data stored on the USB sticks is encrypted either by the e-voting software or using a third-party software provided by the Post.</p> <p>The memory sticks used to backup laptops and store the password safe used by the electoral board provide a PIN-protected hardware encryption mechanism. A dedicated USB stick is used for each backup operation.</p> <p>The smartcards used to store the Admin-Board's keys are also leveraging a PIN-protected encryption mechanism.</p>

Table 128 – Examination results: OEV paragraph 18.4

Management of intangible and tangible resources

Key	19.1
Requirement	All intangible and tangible resources in the sense of the term asset in the standard ISO/IEC 27001, 2013, Information technology - Security techniques - Information security management systems - Requirements , relevant in the context of electronic voting (organisation as a whole, in particular the organisational processes and the information processed in these processes, data carriers, facilities for processing information of the infrastructure and premises of the infrastructure) are recorded in an inventory. A list must be kept of human resources. The inventory and human resources list must be kept up to date. Each intangible and tangible resource is assigned a person who takes responsibility for it.
Observation	The cantons have identified their information assets as part of their risk assessment. The risk assessment basing upon the Octave Allegro methodology, the assets inventory is split into two categories: information assets (i.e., the various types of information processed within the e-voting

	<p>system) and containers (i.e., the processing facilities for the information assets).</p> <p>Processes are not inventoried.</p> <p>A list of the human resources involved in the e-voting processes is drawn up for each ballot.</p>

Table 148 – Examination results: OEV paragraph 23.4

Key	23.5
Requirement	It must be ensured that none of the elements of the client-sided authentication credentials can be systematically intercepted, changed or redirected during transmission. For authentication, measures and technologies must be used that sufficiently minimise the risk of systematic abuse by third parties.
Observation	<p>The cantons are responsible for generating the polling cards (and therefore the voters' authentication credentials), having them printed by the print offices and distributed by post to the voters.</p> <p>The transmission of the voting cards occurs through secure channels (see Number 7.1). Once printed out, the polling cards are packaged by the print offices and collected by the Post for distribution.</p> <p>The technology used for the authentication of voters is under the responsibility of the e-voting system provider.</p>
Evidence	Prozesse E-Voting V0.94, §3.4, step SRA-1, SRA-2, SRA-3
Result	Pass
Finding	N/A
Relevance	N/A

Table 149 – Examination results: OEV paragraph 23.5

Development and maintenance of information systems

Reliable and verifiable compilation and deployment

Key	24.3.5
Requirement	The quality of the evidence of reliable and verifiable compilation and reliable and verifiable deployment must be confirmed by the presence of at

	least two witnesses from different institutions or by technical procedures to establish the truth of the evidence in the light of current academic knowledge and experience.
Observation	The cantons are not involved in the compilation of the software. When deploying the pieces of software on their infrastructure, the cantons verify the hashes of the software files against known-good hashes from the Swiss Post. This process occurs in respect of the 4-eye principle.
Evidence	Prozesse E-Voting V0.94, step 0.3.3
Result	Pass
Finding	N/A
Relevance	N/A

Table 150 – Examination results: OEV paragraph 24.3.5

Key	24.3.6
Requirement	The chain of evidence of reliable and verifiable compilation and deployment is made publicly available.
Observation	The <i>Konzept Information der Stimmberechtigten</i> document mentions that the hashes of the artefacts from the Trusted Build and Deployment processes are made publicly available on the cantons' websites and e-voting landing page.
Evidence	<ul style="list-style-type: none"> » BS: Konzept Information der Stimmberechtigten V0.91, §9.2 » SG, TG: Konzept Information der Stimmberechtigten V0.91, §10.2
Result	Pass
Finding	N/A
Relevance	N/A

Table 151 – Examination results: OEV paragraph 24.3.6

Systematic correction of flaws

Key	24.4.1
Requirement	Processes are defined for the correction of flaws. The processes include: <ul style="list-style-type: none"> » documentation of specific aspects, in particular with regard to the traceability of flaws for all versions of the software, and of the methods used to ensure that system users have information on flaws, corrections and possible corrective actions;

	<ul style="list-style-type: none"> » the obligation to describe the nature and impact of all security flaws, information on the status of work to find a solution and the corrective measures adopted; » a description of how system users can make reports and enquiries about suspected flaws in the software known to the software developers; » a procedure requiring a timely response and automatic dispatch of security flaw reports and appropriate corrective actions to registered system users who may be affected by the flaw.
Observation	<p>The <i>Konzept Information der Stimmberechtigten</i> document mentions that known flaws are transparently communicated to the e-voting system users. They are published on the Post's source code repository site as well as on its community website. The cantons reference those two information sources on their websites.</p> <p>The Post is responsible for the correction of flaws itself as well as for the detailed content of the vulnerability reports.</p>
Evidence	<ul style="list-style-type: none"> » BS: Konzept Information der Stimmberechtigten V0.91, §9.3 » SG, TG: Konzept Information der Stimmberechtigten V0.91, §10.3
Result	Pass
Finding	N/A
Relevance	N/A

Table 152 – Examination results: OEV paragraph 24.4.1

Learnability

Key	25.6.2
Requirement	Persons who operate and use the system must be trained and provided with the necessary documentation.
Observation	The cantons have a training program for all people operating the system. A mandatory training takes place 2-3 months before each ballot and a short refresher occurs at the start of the second (D2) and third days (D3) of each ballot.
Evidence	<ul style="list-style-type: none"> » BS: Konzept Schulungen und interne Information V0.9, §1.1 » SG, TG: Konzept Schulungen und interne Information V0.9, §2.1
Result	Pass
Finding	N/A
Relevance	N/A

Table 153 – Examination results: OEV paragraph 25.6.2

Key	25.6.3
Requirement	Training includes the opportunity to train on a system designed for training purposes.
Observation	A test system is used for the training of the Admin-Board.
Evidence	<ul style="list-style-type: none"> » BS: Konzept Schulungen und interne Information V0.9, §1.2 » SG, TG: Konzept Schulungen und interne Information V0.9, §2.2
Result	Pass
Finding	N/A

11 Summary of findings and recommendations

18. This section recaps the findings made during the examination, their severity, and provides succinct recommendations to address them.

Key	Art. 11
Finding	The source code of the software used to generate the polling cards and of the helper scripts is not published.
Recommendation	The source code of the software used to generate the polling cards and of the helper scripts should be published to enforce the principle of transparency.

Key	11.1
Finding	The decryption of the votes and the tallying begin before Polling Sunday in the cantons of Basel-Stadt and St. Gallen.
Recommendation	The cantons of Basel-Stadt and St. Gallen should decrypt and tally the vote on Polling Sunday or obtain a derogation from the Federal Chancellery to continue their current practice.

Key	15.1
Finding	The cantons do not provide any detail regarding the “best practices” in place to manage certificates used on the informational cantonal websites dedicated to e-voting.
Recommendation	The best practices regarding the management of the said certificates should be described in details (e.g., generation, distribution, protection of private keys, revocation, renewal, etc.)

Key	15.4
Finding	The examiners did not receive any evidence that the electronic certificates used for data signature originate from a recognised supplier of certificate services under the ESigA.
Recommendation	The cantons should ensure that the certificates they use for data signature are sourced from a recognised supplier of certificate services under the ESigA.
